3D modeling Autodesk Dimension software features a feature called "Customize Dimension", a feature that allows users to use a visual dialog box to enter dimensions, parts, lines, angles, points, text strings, property information, or even a complete drawing. Autodesk BIM 360 is a professional 3D modeler designed specifically for the Autodesk Revit platform. Autodesk BIM 360 includes additional features including personal CAD and 2D drawing tools such as drawing the lines on walls, measuring things and creating more complex geometry like sketches and many others. Autodesk Fusion 360 uses a 3D product called Modo to build 3D models, 3D viewports, 3D animations, and 3D printing. DXF is the native format for the model files created by most 3D CAD software. As well as being a native format, DXF is a textual-based format, meaning that a CAD application can easily export from their native 3D model to DXF. Autodesk provides APIs for creating 3D models in AutoCAD Serial Key with its own 3D modeling software. These are currently 3DS MAX, Maya, and Maya LT. Architectural and landscape design Autodesk Architecture incorporates 3D modeling and visualization features through its Dimension product. Dimension makes it easy to sketch, and with its 3D modeling tools, place, view, and move furniture, materials, and other objects in a 3D environment. Dimension can import and export 3D models from other Autodesk products such as Inventor, Revit, and Navisworks, and can import and export geometry, surfaces, and materials from other CAD applications. The Architectural Graphics Interface (AGI) is Autodesk's technology for sharing and visualizing CAD data. AGI can create a wide variety of visualizations that are interactive and responsive to changes in the CAD models. AGI provides an entirely new user experience when working with design intent. For example, AGI is now used extensively for creating model walkthroughs with live videos, animations and walkthroughs. Pole modeling Pole modeling is a technique used to model the geometry of power lines. Using pole modeling, an engineer can design a virtual representation of an actual power line. Often, this representation is used to ensure that a power line does not interfere with aerial vehicles. Another benefit is that visualizations can be made from this model without the need for manual measurement. Pole modeling requires the use of a 1d647c40b
